

# BLAZE-1 Study Fact Sheet

## Considering the BLAZE-1 Study?

COVID-19 was identified in late 2019 and has since impacted the lives of millions of people around the world. There are currently no approved treatments for this new disease, which is why we need clinical research to test potential treatment options. Participating in a clinical research study such as the BLAZE-1 Study is one way you could help contribute to ending this crisis.

## Purpose of the BLAZE-1 Study

The purpose of the BLAZE-1 Study is to test whether the antibody medicine LY-CoV555 may help the body fight the disease. Many antibody medications have been FDA approved to treat health conditions including cancers, autoimmune disorders, and other infectious diseases.

## About the Study Drug

Antibodies are protective proteins made by the body's immune system to fight viruses, bacteria, and other foreign substances. It takes time for the body to make antibodies against a new disease. LY-CoV555 is an antibody derived from an early survivor of COVID-19, and we are testing to see if it may help the body clear the virus faster and reduce symptoms when given soon after diagnosis.

LY-CoV555 is investigational, which means it has not been approved by the FDA for any use. If you participate in this study, you will receive either LY-CoV555 or a placebo, which looks like LY-CoV555 but contains no active medicine. You will not know which one you've received.

## Study Participation

Participation lasts approximately 12 weeks and may include at least 30 visits to see how you are feeling, how your body is responding to LY-CoV555, and how much virus is left in your body. Most of these check-ins will be performed in your home or by phone.

The study is made up of three sections.

- **Screening and treatment:** You will go through an informed consent process to make sure you understand the study and to determine if you are eligible. If you are eligible and decide to participate, you will receive LY-CoV555 or the placebo via a single injection into a vein.

- **Assessments and procedures:** The research team will perform certain tests and procedures to monitor your health and how your body reacts to LY-CoV555. These tests and procedures include physical exams, vital sign measurement, blood samples, and samples taken from the back of the nose to determine how much virus is in your body. Your health will be carefully monitored by a team of doctors, nurses, and other research staff. Your safety is their primary concern.

- **Follow-ups:** Follow-up assessments, which are less frequent visits, allow the research team to monitor how you are doing.

## Key Requirements

The following checklist will help determine if the BLAZE-1 Study may be a good fit for you. Place a check mark next to each statement that describes you.

- 18 years of age or older
- Tested positive for COVID-19 within three days prior to receiving this fact sheet
- Experiencing one or more of the following mild to moderate COVID-19 symptoms: fever, cough, sore throat, headache, muscle pain, nausea, abdominal pain, diarrhea, shortness of breath when active
- No serious medical conditions or infections other than COVID-19
- Not pregnant or breastfeeding
- Not hospitalized

There are additional eligibility requirements, which the study doctor can explain to you.

## Opting In and Opting Out of the BLAZE-1 Study

Taking part in a clinical research study is a voluntary decision. You have the right to leave a clinical research study at any time. If you decide to not join or to stop participating, your decision will not impact your ability to seek medical care. The study doctor also has the right to remove you from the study at any time in the interest of your safety.

## Thank you for your interest in the BLAZE-1 Study.
